Progression in Written Methods for Addition

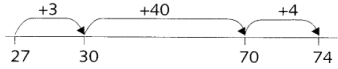

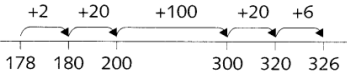

These notes show the stages in building up to a compact, efficient method for addition. Our aim is that children use mental methods when appropriate but for calculations that they cannot do in their heads they choose an appropriate written method which they can use accurately and with confidence. Time must be taken building up to the most efficient method to ensure complete understanding at each stage.

<p>Children need to be able to:</p> <ul style="list-style-type: none"> ▪ recall addition pairs to $9 + 9$ ▪ know all complements to 10 ▪ add mentally a series of single-digit numbers, such as $5 + 8 + 4$ ▪ count on in 1s, 10s and 100s ▪ partition numbers in ways other than into tens and ones to help with bridging multiples of 10 and 100 	<p>Children need to be able to:</p> <ul style="list-style-type: none"> ▪ partition numbers into hundreds, tens and ones ▪ recall addition pairs to $9 + 9$ ▪ add multiples of 10 or 100 (such as $60 + 70$ or $600 + 700$) using a related fact ($6 + 7$) and knowledge of place value ▪ mentally add multiples of 100, 10 and 1 e.g. $800 + 130 + 12$ 														
<p><u>Empty Number Line</u></p> <p>The empty number line helps to record the steps on the way to calculating the total. The steps often bridge through a multiple of 10.</p> <p>Example:</p> <p>$48 + 36 = 84$</p>  <p>Or:</p> 	<p><u>Partitioning</u></p> <p>When adding larger numbers, it becomes less efficient to count on so partitioning is used. Partition into (hundreds) tens and ones, add to form partial sums and then recombine.</p> <table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse;"> <tr> <td style="padding: 2px;">$47 + 76 =$</td> <td style="padding: 2px;">$76 + 47$</td> </tr> <tr> <td style="padding: 2px;">$40 + 7 + 70 + 6$</td> <td style="padding: 2px;">$76 + 40 = 116$</td> </tr> <tr> <td style="padding: 2px;">$40 + 70 = 110$</td> <td style="padding: 2px;">$116 + 7 = 123$</td> </tr> <tr> <td style="padding: 2px;">$7 + 6 = 13$</td> <td></td> </tr> <tr> <td style="padding: 2px;">$110 + 13 = 123$</td> <td></td> </tr> </table> <p>Partitioning all the numbers mirrors the standard column method where ones are placed under ones and tens under tens etc.</p> <p>Example:</p> <p>Partitioned numbers are written under one another:</p> $47 + 76 = 40 + 7$ $= \underline{70} + \underline{6}$ $110 + 13 = 123$ $375 + 567 = 300 + 70 + 5$ $\underline{500} + \underline{60} + \underline{7}$ $800 + 130 + 12 = 942$	$47 + 76 =$	$76 + 47$	$40 + 7 + 70 + 6$	$76 + 40 = 116$	$40 + 70 = 110$	$116 + 7 = 123$	$7 + 6 = 13$		$110 + 13 = 123$		<p><u>Expanded Column Method</u></p> <p>The expanded method leads children to the more compact column method so that they understand the structure and efficiency of it.</p> <p>The amount of time that should be spent teaching and practising the expanded method will depend on how secure the children are in their recall of number facts and in their understanding of place value.</p> <p>Example: Write the numbers in columns:</p> <table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse;"> <tr> <td style="padding: 5px; text-align: center;"> Add the ones first TU 47 + 76 <hr style="width: 50%; margin: 0 auto;"/> 13 (6 + 7) 110 (40 + 70) 123 </td> </tr> </table>	Add the ones first TU 47 + 76 <hr style="width: 50%; margin: 0 auto;"/> 13 (6 + 7) 110 (40 + 70) 123	<p><u>Column Method</u></p> <p>The method is then shortened and when the column total is a two-digit number, the tens (or hundreds) are carried over into the next column. Use the words 'carry ten' or 'carry one hundred', not 'carry one'.</p> <p>Example:</p> <table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse;"> <tr> <td style="padding: 5px; text-align: center;"> HTU 366 + 458 <hr style="width: 50%; margin: 0 auto;"/> 824 11 </td> </tr> </table> <p>Once learned, this method is quick and reliable. Later, extend to adding three two-digit numbers, two three-digit numbers, and numbers with different numbers of digits. This method of can also be used to add decimals.</p>	HTU 366 + 458 <hr style="width: 50%; margin: 0 auto;"/> 824 11
$47 + 76 =$	$76 + 47$														
$40 + 7 + 70 + 6$	$76 + 40 = 116$														
$40 + 70 = 110$	$116 + 7 = 123$														
$7 + 6 = 13$															
$110 + 13 = 123$															
Add the ones first TU 47 + 76 <hr style="width: 50%; margin: 0 auto;"/> 13 (6 + 7) 110 (40 + 70) 123															
HTU 366 + 458 <hr style="width: 50%; margin: 0 auto;"/> 824 11

Progression in Written Methods for Subtraction

These notes show the stages in building up to a compact, efficient written method for subtraction. Our aim is that children use mental methods when appropriate but for calculations that they cannot do in their heads they choose an appropriate written method which they can use accurately and with confidence. Time must be taken building up to the most efficient method to ensure complete understanding at each stage.

<p>Children need to be able to:</p> <ul style="list-style-type: none"> recall all addition and subtraction facts to 20; subtract multiples of 10 (such as 160 - 70) using the related subtraction fact (16 - 7) and their knowledge of place value know all complements to 10 and 100 	<p>Children need to be able to:</p> <ul style="list-style-type: none"> partition two-digit and three-digit numbers into multiples of one hundred, ten and one partition numbers in different ways. e.g. 74 into 70 + 4 or 60 + 14 subtract mentally a single-digit number or a multiple of 10 from a two-digit number add the totals (of the hundreds, tens and ones columns) mentally 																							
<p style="text-align: center;">Empty Number Line</p> <p>Empty or numbered lines are a useful way of modelling processes such as bridging through multiples of ten. The steps can be recorded by counting on or back.</p> <p>Counting on example: 74 - 27 = 47</p>  <p>326 - 178 = 148</p>  <p>Counting back example: 15 - 7 = 8</p>  <p>74 - 27 = 47</p>  <p>The steps may be recorded in a different order or combined. With practice children will record less information and decide whether to count on or back.</p>	<p>Expanded column method</p>	<p>Over time, recording is refined</p>	<p>Over time, recording is refined</p>																					
2 digit numbers with 1 adjustment needed: 74 - 27 =																								
Partition into tens and ones. Then say, "There is not enough to subtract 7 from 4", rather than, "You <i>can't</i> subtract 7 from 4".	70 + 4 is then readjusted to become 60 + 14. The calculation can now be carried out.	$\begin{array}{r} 60 \quad 14 \\ 70 + 4 \\ - 20 + 7 \\ \hline 40 + 7 \end{array}$	$\begin{array}{r} 67 \quad 14 \\ - 27 \\ \hline 47 \end{array}$ <p>Say, "60 - 20" or, "6 tens - 2 tens" not, "6 - 4"</p>																					
<table style="margin: auto;"> <tr><td style="padding: 0 5px;">T</td><td style="padding: 0 5px;">U</td></tr> <tr><td style="padding: 0 5px;">70</td><td style="padding: 0 5px;">+ 4</td></tr> <tr><td style="padding: 0 5px;">- 20</td><td style="padding: 0 5px;">+ 7</td></tr> </table>	T	U	70	+ 4	- 20	+ 7	<table style="margin: auto;"> <tr><td style="padding: 0 5px;">T</td><td style="padding: 0 5px;">U</td></tr> <tr><td style="padding: 0 5px;">60</td><td style="padding: 0 5px;">+ 14</td></tr> <tr><td style="padding: 0 5px;">- 20</td><td style="padding: 0 5px;">+ 7</td></tr> <tr><td style="padding: 0 5px;">40</td><td style="padding: 0 5px;">+ 7</td></tr> </table>	T	U	60	+ 14	- 20	+ 7	40	+ 7

Progression in Written Methods for Multiplication

These notes show the stages in building up to a compact, efficient method for multiplication. Our aim is that children use mental methods when appropriate but for calculations that they cannot do in their heads they choose an appropriate written method which they can use accurately and with confidence. Time must be taken building up to the most efficient method to ensure complete understanding at each stage.

<p>Children need to be able to:</p> <ul style="list-style-type: none"> ♦ count in steps ♦ understand multiplication as repeated addition 	<p>Children need to be able to:</p> <ul style="list-style-type: none"> ♦ partition numbers into multiples of one hundred, ten and one and in other ways ♦ recall multiplication facts to 10×10 ♦ work out products such as 70×5, 70×50, 700×5, or 700×50, using the related fact, 7×5, and an understanding of place value ♦ add combinations of numbers mentally or using a written method 																																																																															
Method 1 - Repeated addition	Method 2 - Grid method into short/long multiplication																																																																															
<p>Children start by understanding multiplication as arrays and repeated addition. They use this understanding to help them work out multiplication facts they cannot recall quickly</p> <p>Example: For '8 x 5', children picture:</p> <div style="display: flex; align-items: center; gap: 20px;"> <div style="text-align: center;">  </div> <div style="text-align: center;">or</div> </div> <p>They use repeated addition to work out the calculation:</p> <div style="text-align: center;"> $5 + 5 + 5 + 5 + 5 + 5 + 5 + 5 = 40$  </div> <p>Recording of the steps on the number line may be refined as understanding and knowledge of facts develops:</p> <p>Example: 12×6</p> <div style="text-align: center;">  </div> <p>This will support children in learning their tables using known facts and in understanding the distributive law which they will apply later when using the grid method.</p>	<p>Multiplications can be carried out using the law of distribution which allows the numbers to be partitioned and each part to be multiplied separately. The products are then added to find the total product.</p> <div style="text-align: center; padding: 10px;"> <p>Stage 1 - Grid method</p> <p>When multiplying a 1-digit number by a 2-digit number, children partition the numbers</p> <div style="display: flex; align-items: center; justify-content: center; gap: 20px;"> <div style="text-align: center;"> 38×7 </div> <div style="border: 1px solid black; padding: 5px;"> <table style="border-collapse: collapse; text-align: center;"> <tr><td style="border: none;">X</td><td style="border: none;">7</td><td style="border: none;"></td></tr> <tr><td style="border: none;">30</td><td style="border: none;"></td><td style="border: none;">210</td></tr> <tr><td style="border: none;">8</td><td style="border: none;"></td><td style="border: none;">56</td></tr> <tr><td style="border: none;"></td><td style="border: none;"></td><td style="border: none;">266</td></tr> </table> </div> </div> <p>Ensure that children understand the relationship between 7×3 and 7×30 and are not simply 'adding a nought'</p> </div> <div style="text-align: center; padding: 10px;"> <p>The same method can also be applied when multiplying a 1-digit number by a 3-digit number:</p> <div style="display: flex; align-items: center; justify-content: center; gap: 20px;"> <div style="text-align: center;"> 549×6 </div> <div style="border: 1px solid black; padding: 5px;"> <table style="border-collapse: collapse; text-align: center;"> <tr><td style="border: none;">x</td><td style="border: none;">6</td><td style="border: none;"></td></tr> <tr><td style="border: none;">500</td><td style="border: none;"></td><td style="border: none;">3000</td></tr> <tr><td style="border: none;">40</td><td style="border: none;"></td><td style="border: none;">240</td></tr> <tr><td style="border: none;">9</td><td style="border: none;"></td><td style="border: none;">54</td></tr> <tr><td style="border: none;"></td><td style="border: none;"></td><td style="border: none;">3294</td></tr> </table> </div> </div> <p>Ensure that children understand the relationship between 6×5 and 6×500 and are not simply 'adding 2 noughts'</p> </div> <div style="text-align: center; padding: 10px;"> <p>When multiplying a 2-digit number by a 2-digit number:</p> <div style="display: flex; justify-content: space-around;"> <div style="border: 1px solid black; padding: 5px; text-align: center;"> <table style="border-collapse: collapse; text-align: center;"> <tr><td style="border: none;">X</td><td style="border: none;">20</td><td style="border: none;">7</td><td style="border: none;"></td></tr> <tr><td style="border: none;">50</td><td style="border: none;">1000</td><td style="border: none;">35</td><td style="border: none;"></td></tr> <tr><td style="border: none;"></td><td style="border: none;"></td><td style="border: none;">0</td><td style="border: none;"></td></tr> <tr><td style="border: none;">6</td><td style="border: none;">120</td><td style="border: none;">42</td><td style="border: none;"></td></tr> </table> </div> <div style="border: 1px solid black; padding: 5px; text-align: center;"> <table style="border-collapse: collapse; text-align: center;"> <tr><td style="border: none;">X</td><td style="border: none;">20</td><td style="border: none;">7</td><td style="border: none;"></td></tr> <tr><td style="border: none;">50</td><td style="border: none;">1000</td><td style="border: none;">35</td><td style="border: none;">1350</td></tr> <tr><td style="border: none;"></td><td style="border: none;"></td><td style="border: none;">0</td><td style="border: none;"></td></tr> <tr><td style="border: none;">6</td><td style="border: none;">120</td><td style="border: none;">42</td><td style="border: none;">162</td></tr> </table> </div> <div style="border: 1px solid black; padding: 5px; text-align: center;"> <table style="border-collapse: collapse; text-align: center;"> <tr><td style="border: none;">X</td><td style="border: none;">20</td><td style="border: none;">7</td><td style="border: none;"></td></tr> <tr><td style="border: none;">50</td><td style="border: none;">1000</td><td style="border: none;">350</td><td style="border: none;">1350</td></tr> <tr><td style="border: none;"></td><td style="border: none;"></td><td style="border: none;">42</td><td style="border: none;"></td></tr> <tr><td style="border: none;">6</td><td style="border: none;">120</td><td style="border: none;">42</td><td style="border: none;">162</td></tr> <tr><td style="border: none;"></td><td style="border: none;"></td><td style="border: none;"></td><td style="border: none;">1512</td></tr> </table> </div> </div> </div>	X	7		30		210	8		56			266	x	6		500		3000	40		240	9		54			3294	X	20	7		50	1000	35				0		6	120	42		X	20	7		50	1000	35	1350			0		6	120	42	162	X	20	7		50	1000	350	1350			42		6	120	42	162				1512

Brook House Junior School
Progression in Written Methods for Division

These notes show the stages in building up to a compact, efficient method for division. Our aim is that children use mental methods when appropriate but for calculations that they cannot do in their heads they choose an appropriate written method which they can use accurately and with confidence. Time must be taken building up to the most efficient method to ensure complete understanding at each stage.

<p>Children need to be able to:</p> <ul style="list-style-type: none"> ▪ understand division as grouping and sharing ▪ understand multiplication and division as inverse operations ▪ recall multiplication and division facts to 10×10 ▪ understand remainders ▪ derive larger multiples using known facts e.g. $10 \times 3 = 30 \rightarrow 20 \times 3 = 60$ etc ▪ add multiples mentally and work out differences 	<p>Use with the most able children who have a secure understanding of all the previous steps.</p>	<p>Use with the most able children who have a secure understanding of all the previous steps.</p>
<p>Stage 1 - Repeated addition</p> <p>When it is not appropriate to use a sharing method for division and the division fact is not known, repeated addition (using the relationship between multiplication and division) can be used.</p> <p>Example without remainder: $40 \div 5$ fives Ask "How many 5s in 40?"</p>  <p>Example with remainder: $38 \div 6$ with a remainder of 2</p>  <p>Mental Method Only For larger numbers, when it becomes inefficient to count in single multiples, bigger jumps can be recorded using known facts.</p> <p>Example without remainder: $81 \div 3$</p>  <p>This could either be done by working out the numbers of threes in each jump as you go along (10 threes are 30, another 10 threes makes 60, and another 7 threes makes 81. That's 27 threes altogether) or by counting in jumps of known multiples of 3 to reach 81 ($30 + 30 + 21$) then working out the number of threes in each jump.</p> <p>Example with remainder: $158 \div 7$</p>  <p>10 sevens are 70, add another 10 sevens is 140, add 2 more sevens is 154 add 2 makes 158. So there are 22 sevens with a remainder of 2. The remainder is indicated above the jump rather than inside it, so that children do not mistakenly add 10, 10, 2 and 2 and get an answer of 24.</p>	<p>Stage 2 - Short Division</p> <p>Example without remainder: $81 \div 3$</p>  <p>Children use their knowledge of the 3 times table to find, "How many 3s in 80 where the answer is a multiple of 10?" This gives 20 threes (since 30 threes would be too many), with 20 remaining (2 tens are carried over to the next column) Now ask: 'How many threes in 21'.</p> <p>Example with remainder:</p>  <p>Once children's understanding of this method is secure they might shorten their dialogue to:</p> <p>"How many 6s in 28?" "4 remainder 4" "How many 6s in 44?" "7 remainder 2"</p> <p>BUT ensure children have a secure understanding of what they are doing and are able to use their knowledge of related facts to either make a rough estimate first or have an idea about whether their final answer is reasonable or not.</p>	<p>Stage 3 - Long Division</p>
